## 1 Overview: variable displacement axial piston pump types V30E

Variable displacement axial piston pumps operate according to the bent axis principle. They adjust the geometric output volume from maximum to zero. As a result they vary the flow rate that is provided to the loads.

The axial piston pump type V30E is designed for open circuits in mobile hydraulics and operate according to the swash plate principle. They are available with the option of a thru-shaft for operating additional hydraulic pumps in series.

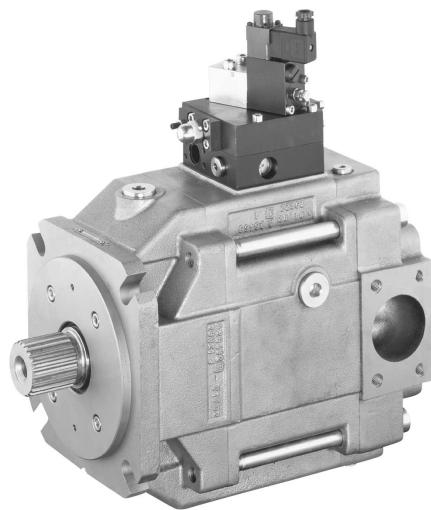

The sturdy pump is particularly suitable for continuous operation in challenging applications. The range of pump controllers allows the axial piston pump to be used in a variety of applications.

### Features and benefits:

- Low noise emissions
- Wide controller options
- Full torque available at the second pump in tandem pump applications

### Intended applications:

- Machines for forestry and agricultural purposes
- Cranes and lifting equipment
- Construction machines

**Table 8 Controllers**

Coding	Description	
-... P -		Pressure controller with pre-set pressure on the integrated pilot valve and connection for external pilot valve. The pressure controller automatically maintains a constant system pressure independently of the required delivery flow. Therefore, it is suited to constant pressure systems where differing delivery flows are required or for efficient pressure limitation of a hydraulic system. The pre-set pressure can be adjusted at a later point.
-... Pb -		Coding Pb with external feedback of the pump pressure to compensate for a pressure loss in the pump pressure line.
-... LSP -		Load-sensing controller with pressure limitation. Stand-by pressure adjustable from 20 to 35 bar. Default differential pressure setting: 27 bar
-... LSPb -		Coding LSPb with external feedback of the pump pressure to compensate for a pressure loss in the pump pressure line.
- PMVPS 4 - 41 /G 12 - 42 /G 24 - 43 /G 24	Pressure range -41: (5) ... 180 bar -42: (5) ... 290 bar -43: (5) ... 440 bar	Additional, directly mounted proportional pressure-limiting valve for setpoint adjustment for the pressure controller (nominal voltage 12 V DC or 24 V DC with specification of the relevant max. pressure range). Can be combined with all controllers listed above. Valve type PMVPS 4 is used in accordance with <a href="#">D 7485/1</a> . Retrofitting is possible at any time. <b>Order coding example:</b> V30E-095 RDGN - 1 - 0 - XX / P - PMVPS 4 - 43 / G 24 - 350
- BVPM 1 S /G 12 R /G 24	S: Energised closed (deenergised open) R: Energised open (deenergised closed)	Additional, directly mounted 2/2-way directional seated valve for pump direction switching (nominal pressure/stand-by pressure) <b>Order coding example:</b> V30E-095 RDGN - 1 - 0 - XX / P - BVPM 1 S / G 24 - 350

**Table 8 Controllers**

Coding	Description
<b>EM.CH</b>	<p>The electro-hydraulic delivery volumetric flow controller adjusts the displacement volume of the pump between "zero" and "maximum" in proportion to an electrical input signal, (target 0 ... 10 V or 0 ... 20 mA). The power for the adjustment is taken from the high-pressure line. For system pressures below 50 bar, an additional auxiliary pump is required (thru-shaft). Corresponding auxiliary pump in accordance with Section 7.1: V30E-095: Z 02-5, V30E-160: Z 02-8, V30E-270: Z 02-10 The control system consists of the pump adjustment system, an NG 6 prop. directional valve and a pivoting angle pick-up (coding 2) for actual value determination. Control electronics (coding CH, type DAC-4) compare the setpoint and actual values and supply the solenoid valves with the appropriate current. The control electronics used offer a wide range of options for individual adaptation, such as ramps and setpoint recall.</p> <p><b>Note</b> The adjustment times are approx. 200 ms.</p> <p>The adjustment can be combined with pressure controllers (coding P, PMVPS) and/or power controllers (coding L) to limit pressure and/or power.</p> <p><b>Note</b> In addition, a separately assigned overpressure protection (pressure-limiting valve) is also to be provided in the hydraulic circuit to avoid pressure peaks.</p> <p><b>Order coding example:</b>            V30E-095 RKGN - 2 - 2-XX / <b>EMPCH</b> - 250 - C212 - Z 02-6 (version with pressure limitation)            V30E-270 RSFN - 2 - 2-XX / <b>EMLSPCH</b> / 1800 - 350 - C232 - Z 02-11 (version with load-sensing controller)            V30E-160 RDGN - 2 - 2-XX / <b>EMOCH</b> - C222 - Z 02-9 (version without pressure limitation)         </p>
<b>L</b>	<p>The power controller with exact hyperbolic curve is used in the case of greatly varying pressures where the drive motor must also be protected against overloading. The drive torque is limited along the line "Pressure x Geometric displacement = Constant" by the special structure. If, for example, the pressure doubles at constant rotation speed, the delivery volumetric flow is automatically halved. External mechanical adjustment can be made to the drive torque at any time. Only in combination with pressure controller P. or load-sensing controller LSP. .</p> <p><b>Order coding example:</b>            V30E-160 RKGN - 0 - 1 - XX / <b>PL</b> / 180 - 300            V30E-095 RSFN - 1 - 1 - XX / <b>LSPL</b> / 120 - 200 - C 211         </p>
<b>Lf</b>	As for coding L. In addition, the set power can be changed (increased) by means of an applied control pressure.
<b>Lf1</b>	As for coding L. In addition, the set power can be changed (reduced) by means of an applied control pressure.
<b>Lfe</b>	As for coding L. In addition, the set power can be changed (increased) electrically.

## 3 Parameters

### 3.1 General

Description	Variable displacement axial piston pump
Design	Axial piston pump according to the swash plate principle
Mounting	Flange mounting or foot bracket
Surface	Primed
Drive/output torque	See <a href="#">Chapter 3, "Parameters"</a> , under "Additional parameters"
Installation position	Any (for installation information see <a href="#">Chapter 5, "Assembly, operation and maintenance recommendations"</a> )
Rotating direction	Clockwise or anti-clockwise
Ports	<ul style="list-style-type: none"> <li>▪ Suction port</li> <li>▪ Pressure port</li> <li>▪ Drain port</li> <li>▪ Pressure gauge connection</li> </ul>
Hydraulic fluid	<ul style="list-style-type: none"> <li>▪ Hydraulic oil according to Part 1 to 3; ISO VG 10 to 68 according to DIN 51519</li> <li>▪ Viscosity range: min 10; max 1000 mm<sup>2</sup>/s</li> <li>▪ Optimal operating range between 16 and 35 mm<sup>2</sup>/s</li> <li>▪ Also suitable for biologically degradable hydraulic fluids type HEPG (polyalkylene glycol) and HEES (synthetic ester) at operating temperatures up to approx. +70°C.</li> <li>▪ HFC pressure fluids (water glycol); note installation information in <a href="#">Chapter 5, "Assembly, operation and maintenance recommendations"</a>.</li> </ul>
Purity class	<p><b>ISO 4406</b></p> <hr/> <p>19/17/14</p>
Temperatures	<ul style="list-style-type: none"> <li>▪ Surrounding area: -40°C to +60°C (observe viscosity range)</li> <li>▪ Oil: - 25°C to +80°C (observe viscosity range)</li> <li>▪ Start temperature: To -40°C is permissible (observe start viscosity), as long as the steady-state temperature is at least 20K higher during operation</li> <li>▪ Biologically degradable hydraulic fluids: Not above +70°C</li> </ul>

**Pressure and delivery flow****Operating pressure**See [Chapter 2, "Available versions, main data"](#)**Geometric displacement**See [Chapter 2, "Available versions, main data"](#)**Dimensions**

Type V30E	Without controller (kg)	With controller (kg)

160	74	+3.2	+1.1	+2.7	+6.1
270	126	+3.2	+1.1	+2.7	+6.1

## Additional parameters

Description	Nominal size		
	095	160	270
Max. swash plate angle	15°	15°	15°
Absolute inlet pressure required in open circuit	0.85 bar	0.85 bar	0.85 bar
Minimum operating pressure	15 bar	15 bar	15 bar
Max. permissible housing pressure (static/dynamic)	1 bar/2 bar	1 bar/2 bar	1 bar/2 bar
Max. rotation speed during suction operation and max. swash plate angle at 1 bar abs. Inlet pressure	2500 rpm	2100 rpm	1800 rpm
Max. rotation speed in supply mode	2900 rpm	2500 rpm	2000 rpm
Min. rotation speed in continuous operation	500 rpm	500 rpm	500 rpm
Required drive torque at 100 bar	153 Nm	261 Nm	414 Nm
Drive power at 250 bar and 1450 rpm	66 kW	107 kW	177 kW
Inertia torque	0.0216 kg m <sup>2</sup>	0.03 kg m <sup>2</sup>	0.0825 kg m <sup>2</sup>
lifetime L <sub>h</sub> of shaft bearings at 250 bar, 1450 rpm and max. swash plate angle	20000 h	19000 h	20000 h
Noise level at 250 bar, 1450 rpm and max. swash plate angle (measured in acoustic measurement chamber according to DIN ISO 4412-1 with measuring distance 1 m)	73 dB(A)	74 dB(A)	78 dB(A)

### Note

The minimum operating pressure in the pump line depends on the rotation speed and the pivoting angle; the pressure must not fall below 15 bar under any circumstances.

### Note

The housing pressure is only allowed to be 1 bar higher than the suction pressure.

## Max. permissible drive/output torque

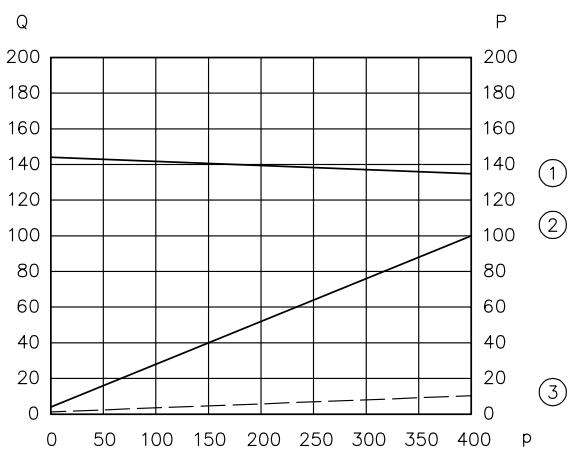

Description	Nominal size			
	095	160	270	
Spline shaft D	Drive/output	1200 Nm/600 Nm	1700 Nm/850 Nm	3400 Nm/1700 Nm
Parallel key K	Drive/output	650 Nm/600 Nm	850 Nm/850 Nm	1700 Nm/1700 Nm
Spline shaft S	Drive/output	1200 Nm/600 Nm	1200 Nm/850 Nm	3100 Nm/1700 Nm
Spline shaft U	Drive/output	--	--	1200 Nm/1200 Nm

### 3.2 Characteristic curves

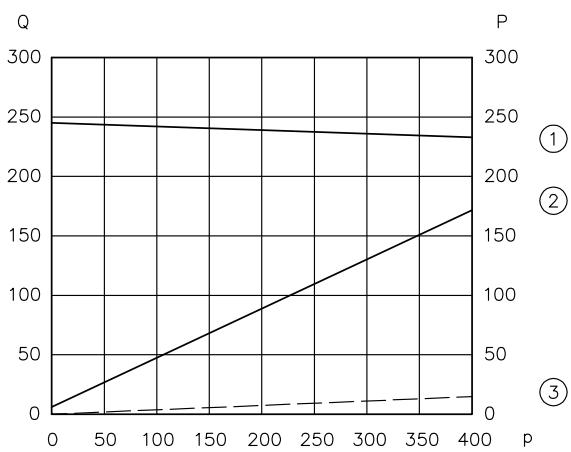

#### Delivery flow and power (basic pump)

The diagrams illustrate the delivery flow/pressure (without controller).  
 Drive power at max. swash plate angle and drive power at zero stroke and 1500 rpm.  
 Drive power/pressure at zero stroke and 1500 rpm

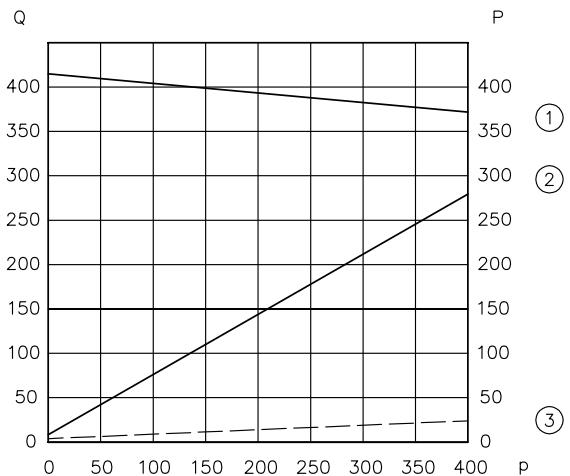

**V30E-095**

**V30E-160**

**V30E-270**

- 2 Drive power/pressure
- 3 Drive power/pressure (zero stroke)

p pressure (bar); Q delivery flow (lpm); P power (kW)

## Inlet pressure and self-suction speed

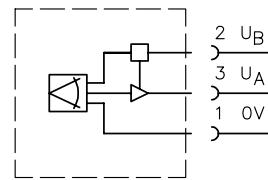

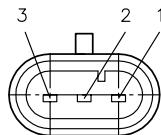

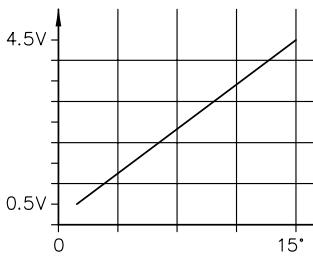

The diagrams show the inlet pressure/rotation speed at the max. swash plate angle and an oil viscosity of 75 mm<sup>2</sup>/s.

1 0 bar relative = 1 bar absolute

## 3.3 Pivoting angle pick-up

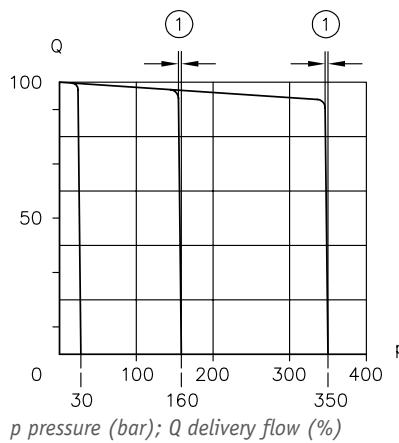

### Pivoting angle pick-up

Operating voltage	U <sub>B</sub> 10 to 30 V DC
Output signal	U <sub>A</sub> 0.5 to 4.5 V
Tested for automotive field	DIN 40839
Test pulse	1, 2, 3 a/b
Field control	200 V/m
Electrical connection	3-PIN AMP
Superseal	1.5 plug

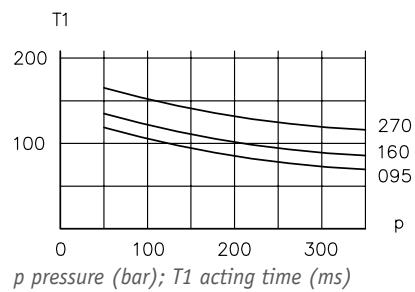

### 3.4 Controller characteristic curves

Coding P

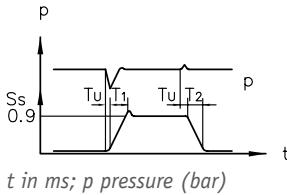

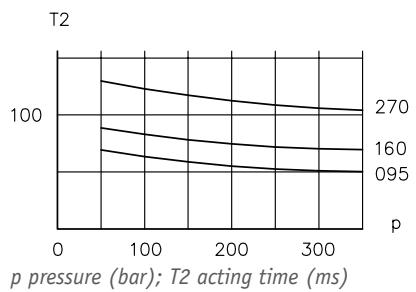

1 Approx. 4 bar

Acting times T1

Acting times T2

$S_s$  = positioning travel of actuator

$T_u$  = delay < 3 ms

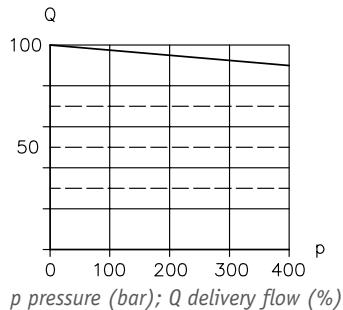

$T_1$  = on-stroke time

$T_2$  = destroke time

p = pressure

Coding LSP

Drive rotation speed constant

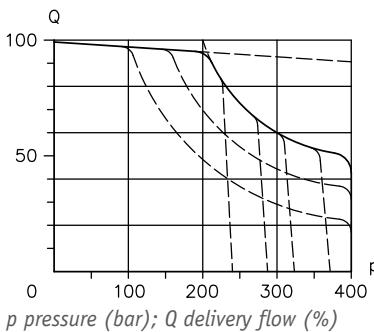

Parameters

**Control accuracy in relation to max. delivery flow**

- Rotation speed n constant,  
pressure variable between 30 and 350 bar (< 3%)
- Pressure p constant,  
rotation speed variable (< 1%)

LS line approx. 10% of the volume of the P line

### Coding L, Lf, Lf1, Lfe

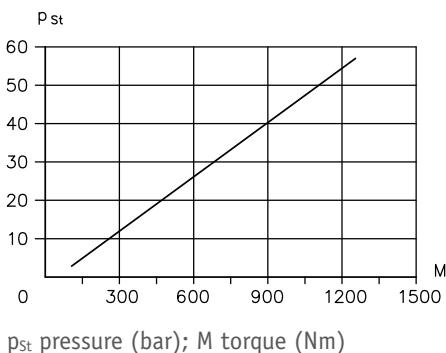

#### Note

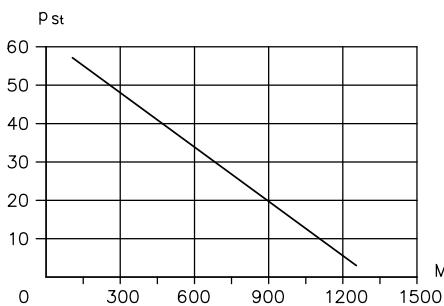

Lowest recommended nominal torque setting.

Coding	Drive torque (Nm)	Corresponds to kW/rpm

## Dimensions

All dimensions in mm, subject to change.

### 4.1 Basic pump

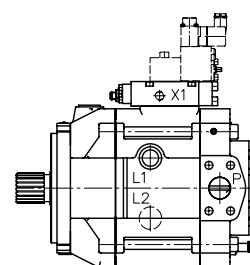

#### 4.1.1 Type V30E-095

Rotating direction **clockwise** (viewed from shaft journal)

- 1 Shaft version
- 2 Flange version
- 3 Housing version
- 4 Controller
- 5 Stroke limitation (approx. 7.5 ccm/rev)

Rotating direction **anti-clockwise** (viewed from shaft journal)

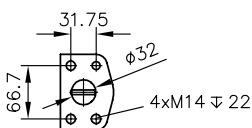

#### Rotating direction clockwise

- A = pressure port
- B = suction port

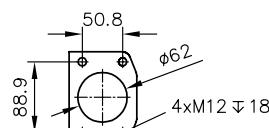

#### Rotating direction anti-clockwise

- A = suction port
- B = pressure port

#### Pressure port

#### Suction port

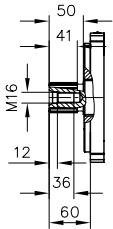

### Shaft versions

#### Spline shaft

Coding **D**

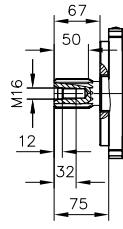

(W45x2x21x9g DIN 5480)

#### Spline shaft

Coding **S**

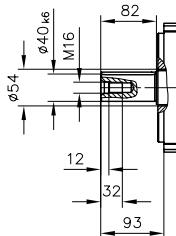

(SAE-D J 744 13T 8/16 DP)

#### Parallel key shaft

Coding **K**

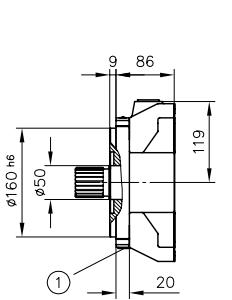

(Ø40 - 12x8x80 DIN 6885)

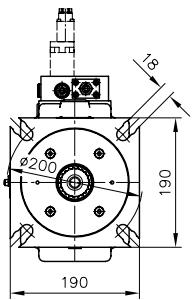

### Flange versions

#### Coding **G**

(160 B4 INSTR DIN ISO 3019-2)

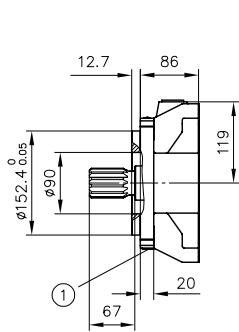

1 Bleeding and flushing port G1/4

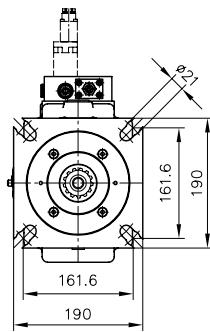

#### Coding **F**

(SAE-D 4-hole J 744)

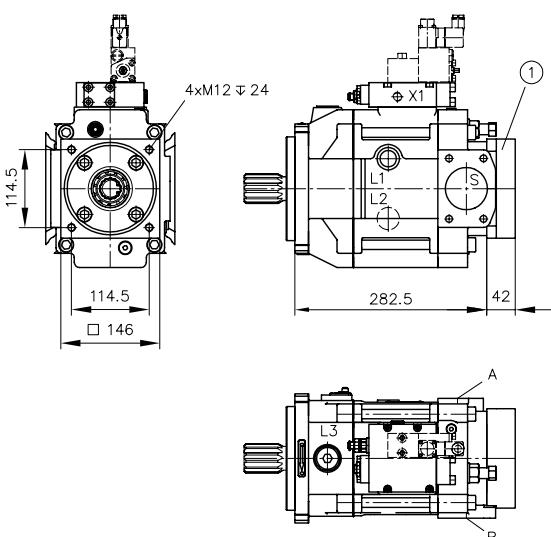

(152-4 DIN ISO 3019-1)

1 Bleeding and flushing port G1/4

### Housing version -2 (radial ports, with thru-shaft)

1 Flange version (output side)

#### Rotating direction clockwise

A = pressure port

B = suction port

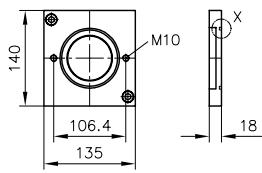

#### Rotating direction anti-clockwise

A = suction port

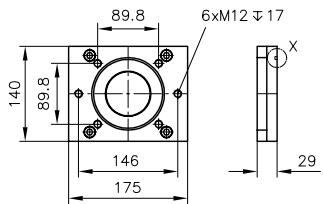

B = pressure port

### Flange version (output side)

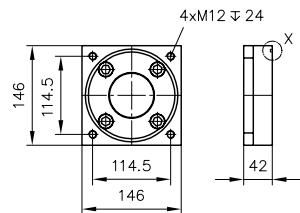

**Coding C211 and C212**

**Risk of injury on overloading components due to incorrect pressure settings!**

Risk of minor injury.

- Always monitor the pressure gauge when setting and changing the pressure.

## 4.4 Pump combinations

### 4.4.1 Pump combinations

A support is to be provided for pump combinations installed horizontally.

Two variable displacement axial piston pumps can be coupled together using an intermediate flange. The sizing of the shafts also permits the transmission of the full torque to the second pump.

Same controller range as for individual pumps.

Available shaft designs: "D" and "S".

Flange versions available for tandem pumps, see [Chapter 2, "Available versions, main data"](#), Table 11

### Order coding example

#### 4.4.2 Combination with dent pump

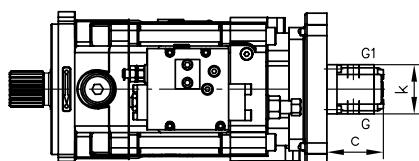

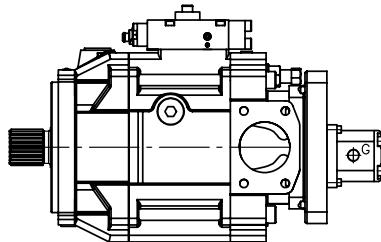

A directly mounted auxiliary or additional gear pump is available.

All pipe work is fitted when a pump with electro-hydraulic prop. adjustment together with directly mounted auxiliary pump is ordered.

##### Order coding example

V30E-160 RKGN 2 -1 - XX / LSP / 280 - C 221 - Z 02-5

##### V30E basic pump

Coding	Geometric displacement $V_g$ (cm³/rev.)	Auxiliary pump for	G (BSPP)	G1 (BSPP)	c	k
Z 02-6	6.0	V30E-095	G 3/8	G 3/8	77	68
Z 02-9	8.40	V30E-160	G 3/8	G 3/8	87	68
Z 02-11	10.80	V30E-270	G 3/8	G 3/8	98	89

##### Note

Auxiliary pump is required for the electro-hydraulic pump adjustment coding EM...

##### Note

With EM a gear pump twice as large as the auxiliary pump can be used on tandem pumps.

##### Note

Values "c" and "k" are reference values only.

Further characteristic values on request!

## 5 Assembly, operation and maintenance recommendations

### 5.1 Intended application

This product is intended exclusively for hydraulic applications (fluid engineering). The product meets high technical safety standards and regulations for fluid and electrical engineering.

The user must observe the safety measures and warnings in this documentation.

Essential requirements for the product to function correctly and safely:

- All information in this documentation must be observed. This applies in particular to all safety measures and warnings.
- The product must only be assembled and put into operation by qualified personnel.
- The product must only be operated within the specified technical parameters. The technical parameters are described in detail in this documentation.
- The operating and maintenance manual of the specific complete system must also always be observed.

If the product can no longer be operated safely:

Remove the product from operation and mark it accordingly. It is then not permitted to continue using or operating the product.

### 5.2 Assembly information

The hydraulic system must only be installed in the complete system with standard connection components that comply with market requirements (screw fittings, hoses, pipes, etc.).

The hydraulic system must be shut down correctly prior to dismantling; this applies in particular to hydraulic systems with hydraulic accumulators.

#### Danger

#### Risk to life caused by sudden movement of the hydraulic drives when dismantled incorrectly!

Risk of serious injury or death.

- Depressurise the hydraulic system.
- Perform safety measures in preparation for maintenance.

## 5.2.1 General information

The V30E variable displacement axial piston pump is designed for use in an open circuit.

The pump can be mounted using a flange in accordance with specifications.

The various controllers can be fitted as intermediate plate versions or as separate devices as required.

### During assembly, note the following principles:

Only trained persons are allowed to mount or remove the pump. Always ensure absolute cleanliness so that no contamination can influence the pump.

- Remove all plastic plugs before operation.
- Avoid installation above the tank (see installation positions in [Chapter 5.2.3, "Installation positions"](#)).
- For electric reference values "Suction intakes" must be adhered to.
- Before initial use, fill the pump with hydraulic fluid and bleed. The pump automatically fills via the suction line when the drain ports are opened.
- Never drain the pump.
- Always supply the pump with hydraulic fluid from the start. Even just a short period with insufficient hydraulic fluid can damage the pump. Such damage is not immediately visible once the pump is put into operation.
- Hydraulic fluid which flows back into the tank must not be sucked back in immediately (install baffles!).
- Before first use, run the pump for approx. 10 minutes at max. 50 bar after initial start-up.
- Only use the entire pressure range of the pump once thorough bleeding and flushing have taken place.
- From the start, always keep the temperature in the specified range (see [Chapter 3, "Parameters"](#)). Never exceed maximum temperatures.
- Always comply with the cleanliness level of the hydraulic fluid. In addition, always filter the hydraulic fluid appropriately (see [Chapter 3, "Parameters"](#)).
- Self-installed filters in the suction line must be approved beforehand by HAWE Hydraulik SE.
- A system pressure-limiting valve must be installed in the pressure line so that the maximum system pressure is not exceeded.

## 5.2.2 Ports

The nominal diameter of the connecting lines depends on the specified operating conditions, the viscosity of the hydraulic fluid, the start-up and operating temperatures and the rotation speed of the pump. In principle we recommend the use of hose lines due to the superior damping characteristics.

### Bleeding and flushing port

The V30E pumps are fitted with a G 1/4" (BSPP) bleeding and flushing port. This is used to bleed and flush the front shaft bearing in the case of vertical installation.

### Pressure port

The pressure port connection is established in the case of type V30E via SAE ports, see [Chapter 4, "Dimensions"](#). Metric attachment threads are used in deviation from the standard.

Observe the tightening torque specified by the fitting manufacturer.

### Suction port

The suction port can be established via SAE ports; see [Chapter 4, "Dimensions"](#). Metric attachment threads are used in deviation from the standard.

If possible, route the suction line to the tank in such a way that it is steadily rising. This allows trapped air to escape. Observe the specifications in "Installation positions" [Chapter 5.2.3, "Installation positions"](#). The absolute suction pressure must not fall below 0.85 bar. A hose line should generally be used in preference to a rigid pipe.

### Drain port

The V30E pumps have 3 drain ports G 3/4" (BSPP) or G 1" (BSPP).

The nominal diameter of the leakage line must not be less than 16 mm. The cross-section is determined by the max. permissible housing pressure.

Integrate the leakage line in the system in such a way as to prevent direct connection with the suction line of the pump.

All drain ports can be used simultaneously.

A separate leakage line from the controller to the tank is not required. Observe the specifications in [Chapter 5.2.3, "Installation positions"](#).

The top drain port can be used to fill the housing.

### LS port for versions LSP

The LS line is connected to the controller via a G 1/4" (BSPP) threaded connection.

The nominal diameter of the line depends on the installation position of the pump and should be 10% of the pressure line nominal volume. A hose line should generally be used in preference to a rigid pipe.

- When the proportional directional spool valve is in a neutral position, the LS line must be fully relieved (only controller type LSNR, LSN). In the case of controller type LSNRT, relief takes place internally in the controller.

**For operation with HFC (35 - 50 % water content) the following restrictions apply**

- The tank is above the pump
- The temperature does not exceed 50°C
- The fluid velocity in the suction line is below 1 m/s
- Pump pressure maximum 200 bar
- The two shaft bearings on a pump are flushed with cool oil via separate feeds, each bearing with 3 lpm (V30E-095), 4 lpm (V30E-160) and 5 lpm (V30E-270)

**For operation with liquids with a water content ≤ 20 % the following restrictions apply**

- The tank is above the pump
- The tank temperature does not exceed 70°C
- The fluid velocity in the suction line is below 1 m/s
- Pump pressure maximum 300 bar
- Possible without bearing flushing

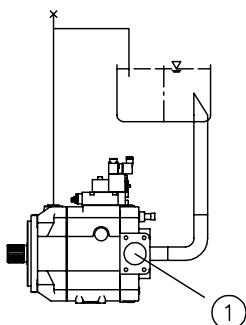

### 5.2.3 Installation positions

The variable displacement axial piston pump V30E can be installed in any installation position.

A support is required for tandem pumps or multiple hydraulic pumps mounted in series. The following points must be observed:

#### Horizontal installation: (pump below the min. fill level)

⇒ For horizontal installation, use the uppermost drain port

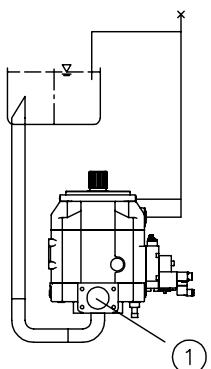

1 Suction port open

#### Vertical installation: (pump below the min. fill level)

- ⇒ Mount the pump so that the pump mounting flange is facing upwards
- ⇒ For vertical installation, use the uppermost drain port
- ⇒ Also connect the G 1/8" bleeding port on the pump flange.
- ⇒ Take appropriate measures to ensure continuous bleeding of this line (line routing/bleeding)

For installation with the pump flange facing downwards, please contact HAWE Hydraulik.

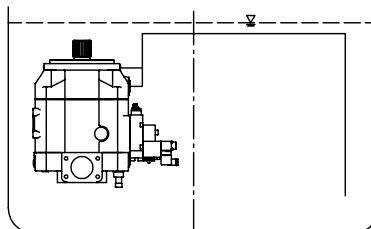

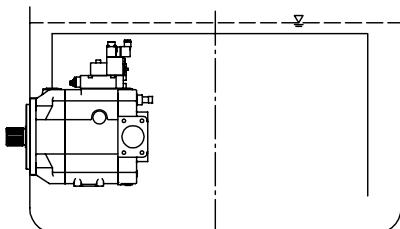

1 Suction port open

## 5.2.4 Tank installation

### Tank installation (pump below the min. fill level)

The pump can be operated either with or without a suction tube. Using a short suction intake is recommended.

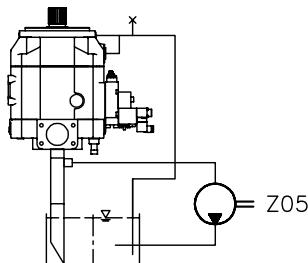

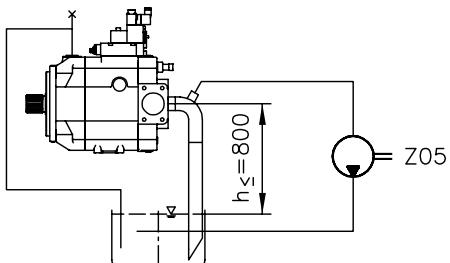

### Additional notes regarding installation above the fill level

Special measures are required if the pump is installed above the fill level. The pump must not run dry via the pressure, intake, drain, bleed or control lines. This applies in particular to long periods of downtime.

- The leakage line must be installed in the tank in such a way that it ends below the oil level.
- Facilitate bleeding of connecting lines via separate bleed openings.
- Adjust the bleeding sequence to the specific installation.
- If necessary, a gear pump should be provided in order to draw air from the suction line.

For specialist advice on designing axial piston pumps, the following contact form is available:  
[Checklist for designing variable displacement axial piston pumps: B 7960 checklist.](#)

For further information on installation, operation and maintenance, see the relevant assembly instructions:  
[B 7960](#), [B 5488](#).

## 5.3 Operating instructions

### Product configuration and setting the pressure and flow rate

The statements and technical parameters in this documentation must be strictly observed.  
The instructions for the complete technical system must also always be followed.

#### Note

- Read the documentation carefully before usage.
- The documentation must be accessible to the operating and maintenance staff at all times.
- Keep documentation up to date after every addition or update.

#### Caution

##### Risk of injury on overloading components due to incorrect pressure settings!

Risk of minor injury.

- Always monitor the pressure gauge when setting and changing the pressure.

### Purity and filtering of the hydraulic fluid

Fine contamination can significantly impair the function of a hydraulic power pack. Contamination can cause irreparable damage.

Examples of fine contamination include:

- Metal chips
- Rubber particles from hoses and seals
- Dirt due to assembly and maintenance
- Mechanical debris
- Chemical ageing of the hydraulic fluid

#### Note

Fresh hydraulic fluid from the drum does not always have the highest degree of purity. Under some circumstances the fresh hydraulic fluid must be filtered before use.

Pay attention to the cleanliness level of the hydraulic fluid in order to maintain faultless operation.

(Also see cleanliness level in [Chapter 3, "Parameters"](#).)

## 5.4 Maintenance information

This product is largely maintenance-free.

Conduct a visual inspection at regular intervals, but at least once per year, to check if the hydraulic connections are damaged. If external leakages are found, shut down and repair the system.

Clean the device surface of dust deposits and dirt at regular intervals, but at least once per year.

## 6 Other information

### 6.1 Planning information

#### Determination of nominal sizes

**Delivery flow**

$$Q = \frac{V_g \cdot n \cdot \eta_V}{1000} (\text{l/min})$$

$V_g$  = Geom. output volume ( $\text{cm}^3/\text{rev.}$ )

$\Delta p$  = Differential pressure

$n$  = Rotation speed (rpm)

$\eta_V$  = Volumetric efficiency

$\eta_{mh}$  = Mechanical-hydraulic efficiency

$\eta_t$  = Overall efficiency ( $\eta_t = \eta_V \cdot \eta_{mh}$ )

**Drive torque**

$$M = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}} (\text{Nm})$$

**Drive power**

$$P = \frac{2\pi \cdot M \cdot n}{60000} = \frac{Q \cdot \Delta p}{600 \cdot \eta_t} (\text{kW})$$
